► For a real number x = 0.x<sub>1</sub>x<sub>2</sub> ··· we can look at the complexity of the prefixes x<sub>0</sub> ··· x<sub>n</sub>.

### Definition Let $f \in C[0, 1]$ , $t \in [0, 1]$ , and $c \in \mathbb{R}$ . t is a *c*-fast time of f if

$$\limsup_{h\to 0} \frac{|f(t+h)-f(t)|}{\sqrt{2|h|\log 1/|h|}} \geq c.$$

t is a *c-slow time* of f if

$$\limsup_{h\to 0}\frac{|f(t+h)-f(t)|}{\sqrt{h}}\leq c.$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへぐ

### Definition Let $f \in C[0, 1]$ , $t \in [0, 1]$ , and $c \in \mathbb{R}$ . t is a *c*-fast time of f if

$$\limsup_{h\to 0} \frac{|f(t+h)-f(t)|}{\sqrt{2|h|\log 1/|h|}} \geq c.$$

t is a *c-slow time* of f if

$$\limsup_{h\to 0}\frac{|f(t+h)-f(t)|}{\sqrt{h}}\leq c.$$

 Both slow and fast times almost surely exist (and form dense sets) [Orey and Taylor 1974, Davis, Greenwood and Perkins 1983].

No time given in advance is slow, but the set of slow times has positive Hausdorff dimension.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ▶ ④ ●

- No time given in advance is slow, but the set of slow times has positive Hausdorff dimension.
- Any set of positive Hausdorff dimension contains some times of high Kolmogorov complexity.

- ロ ト - 4 回 ト - 4 □ - 4

- No time given in advance is slow, but the set of slow times has positive Hausdorff dimension.
- Any set of positive Hausdorff dimension contains some times of high Kolmogorov complexity.
- But actually, all slow points have high Kolmogorov complexity.

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- No time given in advance is slow, but the set of slow times has positive Hausdorff dimension.
- Any set of positive Hausdorff dimension contains some times of high Kolmogorov complexity.
- But actually, all slow points have high Kolmogorov complexity.
- Can prove this using either computability theory or probability theory.

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

### Definition A set is c.e. if it is computably enumerable.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへぐ

A set is c.e. if it is computably enumerable. A set  $A \subseteq \mathbb{N}$  is infinitely often c.e. traceable if there is a computable function p(n) such that for all  $f : \mathbb{N} \to \mathbb{N}$ , if f is computable in A then there is a uniformly c.e. sequence of finite sets  $E_n$  of size  $\leq p(n)$  such that

 $\exists^{\infty}n \ f(n) \in E_n.$ 

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

An infinite binary sequence x is autocomplex if there is a function  $f : \mathbb{N} \to \mathbb{N}$  with  $\lim_{n \to \infty} f(n) = \infty$ , f computable from x, and

 $K(x \upharpoonright n) \ge f(n).$

*x* is infinitely often c.e. traceable iff *x* is not autocomplex.

#### Lemma

If x is not autocomplex then every Martin-Löf random real is Kurtz-random relative to x.

This translates to:

If t ∈ [0, 1] is not of high Kolmogorov complexity then each sufficiently random f ∈ C[0, 1] is such that t is not a slow point of f.

Thus we have a computability-theoretic proof that all slow points are almost surely of high Kolmogorov complexity.

*x* is infinitely often c.e. traceable iff *x* is not autocomplex.

#### Lemma

If x is not autocomplex then every Martin-Löf random real is Kurtz-random relative to x.

This translates to:

If t ∈ [0, 1] is not of high Kolmogorov complexity then each sufficiently random f ∈ C[0, 1] is such that t is not a slow point of f.

Thus we have a computability-theoretic proof that all slow points are almost surely of high Kolmogorov complexity. There are also probability-theoretic methods for proving such things, that can even yield stronger results.

Thus we have a computability-theoretic proof that all slow points are almost surely of high Kolmogorov complexity. There are also probability-theoretic methods for proving such things, that can even yield stronger results. On the other hand, these methods can be applied to computability-theoretic problems.

### Two notions of random closed set

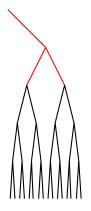

Two probability distributions on closed subsets of Cantor space.

- 1. "Random closed set" (Barmpalias, Brodhead, Cenzer, Dashti, and Weber (2007)). 1/3 probability each of: keeping only left branch, keeping only right branch, keeping both branches.
- 2. Percolation limit set (Hawkes, R. Lyons (1990)). 2/3 probability of keeping the left branch, and independently 2/3 probability of keeping the right branch.

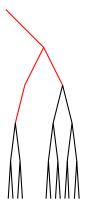

▲□▶ ▲圖▶ ▲≣▶ ▲≣▶ = = -の�?

◆□▶ ◆□▶ ◆ ≧▶ ◆ ≧▶ 差 の Q @

Let  $\gamma = \log_2(3/2)$  and  $\alpha = 1 - \gamma = \log_2(4/3)$ . Barmpalias, Brodhead, Cenzer, Dashti, and Weber define (*Martin-Löf-*)random closed sets and show that they all have dimension  $\alpha$ .

We denote Hausdorff dimension by dim and effective Hausdorff dimension by  $\dim^{\emptyset}.$  Then

$$\dim^{\emptyset}(x) = \liminf_{n} \frac{K(x \upharpoonright n)}{n}$$

 $= \sup\{s : x \text{ is } s\text{-Martin-Löf-random}\}.$ 

(日) (同) (三) (三) (三) (○) (○)

We define a strengthening of Reimann and Stephan's strong  $\gamma$ -randomness, vehement  $\gamma$ -randomness. Both notions coincide with Martin-Löf  $\gamma$ -randomness for  $\gamma = 1$ .

#### Definition

Let  $\rho: 2^{<\omega} \to \mathbb{R}$ ,  $\rho(\sigma) = 2^{-|\sigma|\gamma}$  for some fixed  $\gamma \in [0, 1]$ . For a set of strings V,

$$\rho(V) := \sum_{\sigma \in V} \rho(\sigma)$$

and

.

$$[V] := \bigcup \{ [\sigma] : \sigma \in V \}$$

A ML- $\gamma$ -test is a uniformly c.e. sequence  $(U_n)_{n < \omega}$  of sets of strings such that for all n,

$$\rho(U_n) \leq 2^{-n}.$$

A strong ML- $\gamma$ -test is a uniformly c.e. sequence  $(U_n)_{n < \omega}$  of sets of strings such that

$$(\forall n)(\forall V \subseteq U_n)[V \text{ prefix-free } \Rightarrow \rho(V) \leq 2^{-n}].$$

A vehement ML- $\gamma$ -test is a uniformly c.e. sequence  $(U_n)_{n < \omega}$  such that for each *n* there is a set of strings  $V_n$  with  $[V_n] = [U_n]$  and  $\rho(V) \le 2^{-n}$ .

#### Lemma

Vehemently  $\gamma$ -random  $\Rightarrow$  strongly  $\gamma$ -random  $\Rightarrow \gamma$ -random.

◆□ ▶ ◆□ ▶ ◆三 ▶ ◆三 ▶ ● ○ ○ ○ ○

#### Theorem

Let  $\gamma = \log_2(3/2)$  and let x be a real. We have  $(1) \Leftrightarrow (2) \Rightarrow (3) \Rightarrow (4) \Rightarrow (5)$ .

- 1. x is 1-random;
- 2. x is vehemently 1-random;
- 3. x is vehemently  $\gamma + \frac{1-\gamma}{2} \approx 0.8$ -random;
- 4. x belongs to some random closed set;
- 5. x is vehemently  $\gamma \approx 0.6$ -random.

Corollary (J. Miller and A. Montálban) The implication from (1) to (4).

#### Theorem

Suppose x is a member of a random closed set. Then x is vehemently  $\gamma$ -random.

Proof: Random closed sets are denoted by  $\Gamma$ , whereas  $\mathfrak{S}$  is the set of strings in the tree corresponding to  $\Gamma$ .

Let i < 2 and  $\sigma \in 2^{<\omega}$ . The probability that the concatenation  $\sigma i \in \mathfrak{S}$  given that  $\sigma \in \mathfrak{S}$  is, by definition of the BBCDW model,

$$\mathbb{P}\{\sigma i \in \mathfrak{S} | \sigma \in \mathfrak{S}\} = \frac{2}{3}.$$

Hence the absolute probability that  $\sigma$  survives is

$$\mathbb{P}\{\sigma \in \mathfrak{S}\} = \left(\frac{2}{3}\right)^{|\sigma|} = \left(2^{-\gamma}\right)^{|\sigma|} = \left(2^{-|\sigma|}\right)^{\gamma}$$

Suppose x is not vehemently  $\gamma$ -random. So there is some uniformly c.e. sequence  $U_n = \{\sigma_{n,i} : i < \omega\}$ , such that  $x \in \bigcap_n [U_n]$ , and for some  $U'_n = \{\sigma'_{n,i} : i < \omega\}$  with  $[U'_n] = [U_n]$ ,

$$\sum_{i=1}^{\infty} 2^{-|\sigma'_{n,i}|\gamma} \leq 2^{-n}.$$

Let

$$V_n := \{ \Gamma : \exists i \, \sigma_{n,i} \in \mathfrak{S} \} = \{ \Gamma : \exists i \, \sigma'_{n,i} \in \mathfrak{S} \}.$$

 ・

The first expression shows  $V_n$  is uniformly  $\Sigma_1^0$ . The equality is proved using the fact that  $\mathfrak{S}$  is a tree without dead ends.

Now

$$\mathbb{P}V_n \leq \sum_{i \in \omega} \mathbb{P}\{\sigma'_{n,i} \in \mathfrak{S}\} = \sum_{i \in \omega} 2^{-|\sigma'_{n,i}|\gamma} \leq 2^{-n}.$$

That is, if  $x \in \Gamma$  then x belongs to the effective null set  $\bigcap_{n \in \omega} V_n$ . As  $\Gamma$  is ML-random, this is not the case. End of proof.

### Corollary

If x belongs to a random closed set, then

 $\dim^{\varnothing}(x) \geq \log_2(3/2).$ 

### Corollary (BBCDW)

No member of a random closed set is 1-generic.

#### Theorem

For each  $\varepsilon > 0$ , each random closed set contains a real x with

$$\dim^{\varnothing}(x) \leq \log_2(3/2) + \varepsilon.$$

#### Corollary (BBCDW)

Not every member of a random closed set is Martin-Löf random.

# Open problems

We have seen that the members of random closed sets do not coincide with the reals of effective dimension  $\geq \gamma$ , although (1) they all have dimension  $\geq \gamma$  and (2) they do not all have dimension  $\geq \gamma + \varepsilon$  for any fixed  $\epsilon > 0$ .

There are (at least) two possible conjectures, and the answer may help determine whether *vehement* or ordinary  $\gamma$ -randomness is the most natural generalization of 1-randomness.

# Conjecture (1)

The members of random closed sets are exactly the reals x such that for some  $\varepsilon > 0$ , x is  $\gamma + \varepsilon$ -random. (That is, x has effective dimension  $> \gamma$ .)

### Conjecture (2)

The members of random closed sets are exactly the reals x such that for some  $\varepsilon > 0$ , x is vehemently  $\gamma + \varepsilon$ -random.

Conjecture 1 would imply that

```
\gamma + \varepsilon-random \Rightarrow vehemently \gamma-random.
```

This seems unlikely, but J. Reimann has shown that

 $\gamma + \varepsilon$ -random  $\Rightarrow$  strongly  $\gamma$ -random.
