We prove that the binomial sequence \( \binom{np+r}{n} \) is positive definite if and only if either \( p \geq 1 \), \(-1 \leq r \leq p-1 \) or \( p \leq 0 \), \( p-1 \leq r \leq 0 \) and that the Raney sequence \( \binom{np+r}{np} \) is positive definite if and only if either \( p \geq 1 \), \( 0 \leq r \leq p \) or \( p \leq 0 \), \( p-1 \leq r \leq 0 \) or else \( r = 0 \). The corresponding probability measures are denoted by \( \nu(p, r) \) and \( \mu(p, r) \) respectively. We prove that if \( p > 1 \) is rational and \(-1 < r \leq p-1 \) then the measure \( \nu(p, r) \) is absolutely continuous and its density \( V_{p,r}(x) \) can be represented as Meijer G-function. In some cases \( V_{p,r} \) is an elementary function. We show that for \( p > 1 \) the measures \( \nu(p, -1) \) and \( \nu(p, 0) \) are certain free convolution powers of the Bernoulli distribution.

Keywords: Mellin convolution; Meijer G-function; free probability.

AMS Subject Classification: 44A60, 33C20, 46L54

1. Introduction

This paper is devoted to binomial sequences, i.e. sequences of the form

\[
\left\{ \binom{np+r}{n} \right\}_{n=0}^{\infty},
\]

(1.1)
where \(p, r\) are real parameters. Here the generalized binomial symbol is defined by: \(\binom{a}{n} := a(a - 1) \cdots (a - n + 1)/n!\). For example, the numbers \(\binom{2n}{n}\) are moments of the arcsine law

\[
\frac{1}{\pi \sqrt{x(4-x)}} \chi_{(0,4)}(x) \, dx
\]

(see Ref. 2). We are going to prove that if \(p \geq 1\), \(-1 \leq r \leq p - 1\), then the sequence (1.1) is positive definite and the support of the corresponding probability measure \(\nu(p, r)\) is contained in the interval \([0, c(p)]\), where

\[
c(p) := \frac{p^p}{(p - 1)^{p-1}}. \tag{1.2}
\]

For \(r = -1\), this measure has an atom at \(x = 0\). If in addition \(p > 1\) is a rational number, \(-1 < r \leq p - 1\), then \(\nu(p, r)\) is absolutely continuous and the density function \(V_{p,r}\) can be expressed in terms of the Meijer \(G\)-function (and consequently of the generalized hypergeometric functions). In particular cases \(V_{p,r}\) is an elementary function.

Similar problems were studied in Refs. 6 and 7 for Raney sequences

\[
\left\{ \binom{np + r}{n} \binom{r}{np + r} \right\}_{n=0}^\infty \tag{1.3}
\]

(called Fuss sequences if \(r = 1\)). It was shown that if \(p \geq 1\) and \(0 \leq r \leq p\) then the Raney sequence (1.3) is positive definite and the corresponding probability measure \(\mu(p, r)\) has compact support contained in \([0, c(p)]\). In particular \(\mu(2, 1)\) is the Marchenko–Pastur distribution, which plays an important role in the theory of random matrices.\(^9\)\(^1\)\(^1\)\(^7\)\(^1\)\(^8\) Moreover, for \(p > 0\) we have \(\mu(p, 1) = \mu(2, 1)^{\frac{2}{p-1}}\), where “\(^{\frac{2}{p-1}}\)” denotes the multiplicative free convolution.

The paper is organized as follows. First we study the generating function \(D_{p,r}\) of the sequence (1.1). For particular cases, namely for \(p = 2, 3, 3/2\), we express \(D_{p,r}\) as an elementary function. In the next section we prove that if \(p \geq 1\) and \(-1 \leq r \leq p - 1\) then the sequence is positive definite and the support of the corresponding probability measure \(\nu(p, r)\) is contained in \([0, c(p)]\). If \(p > 1\) is rational and \(-1 < r \leq p - 1\) then \(\nu(p, r)\) can be expressed as the Mellin convolution of modified beta measures, in particular \(\nu(p, r)\) is absolutely continuous, while \(\nu(p, -1)\) has an atomic part at 0. Recall that the positive definiteness of the binomial sequence (1.1) was already proved in Ref. 6 under more restrictive assumptions (namely, that \(0 \leq r \leq p - 1\)), and the proof involved the multiplicative free, the boolean and the monotonic convolution.

In the next section we study the density function \(V_{p,r}\) of the absolutely continuous measures \(\nu(p, r)\), where \(p > 1\) is rational, \(-1 < r \leq p - 1\). We show that \(V_{p,r}\) can be expressed as the Meijer \(G\)-function, and therefore as linear combination of the generalized hypergeometric functions. In particular we derive an elementary formula for \(p = 2\). Then we concentrate on the cases \(p = 3\) and \(p = 3/2\). For particular choices of \(r\) (namely, \(r = 0, 1, 2\) for \(p = 3\) and \(r = -1/2, 0, 1/2\) for \(p = 3/2\)) we express \(V_{p,r}\) as an elementary function (Theorems 5.1 and 5.2).
Some of the sequences (1.1) have combinatorial applications and appear in the Online Encyclopedia of Integer Sequences\textsuperscript{14} (OEIS). Perhaps the most important is $\binom{2n}{n}$ (A000984 in OEIS), the moment sequence of the arcsine distribution. The sequences $\binom{3n-1}{n}$, $\binom{3n+1}{n}$, and $\binom{3n+2}{n}$ can be found in OEIS as A165817, A005809, A045721 and A025174 respectively. We also shed some light on sequence A091527: $\binom{3n/2-1/2}{n}^4$, as well as on A061162, the even numbered terms of the former (see remarks following Theorem 5.2).

In Sec. 6 we study various convolution relations involving the measures $\nu(p, r)$ and $\mu(p, r)$. For example we show in Proposition 6.2 that the measures $\nu(p, -1)$ and $\nu(p, 0)$ are certain free convolution powers of the Bernoulli distribution.

In Sec. 7 we prove that the binomial sequence (1.1) is positive definite if and only if either $p \geq 1$, $-1 \leq r \leq p - 1$, or $p \leq 0$, $p - 1 \leq r \leq 0$. The measures corresponding to the latter case are reflections of those corresponding to the former one. Similarly, the Raney sequence (1.3) is positive definite if and only if either $p \geq 1$, $0 \leq r \leq p$ or $p \leq 0$, $p - 1 \leq r \leq 0$ or else $r = 0$. Quite surprisingly, the proof involves the monotonic convolution due to Muraki.\textsuperscript{8} For the Raney sequences a different proof is contained in the recent work of Liu and Pego.\textsuperscript{4} Finally, we provide graphical representation for selected functions $V_{p, r}$.

Let us mention that Simon\textsuperscript{15} observed that the measure $\nu(p, 0)$ is the distribution of $f_p(U)$, where $U$ is the uniform random variable on $[0, 1]$ and

\begin{equation}
\frac{\sin^p(\pi u)}{\sin(\pi u/p)\sin^p((1-1/p)\pi u)}.
\end{equation}

2. Generating Functions

In this section we are going to study the generating function

\[D_{p, r}(z) := \sum_{n=0}^{\infty} \binom{np + r}{n} z^n\]

(convergent in some neighborhood of 0) of the binomial sequence (1.1). First we observe relations between the functions $D_{p, -1}$, $D_{p, 0}$ and $D_{p, p-1}$.

**Proposition 2.1.** For every $p \in \mathbb{R}\setminus\{0\}$ we have

\[D_{p, -1}(z) = \frac{1}{p} + \frac{p-1}{p} D_{p, 0}(z)\]

and

\[D_{p, p-1}(z) = \frac{D_{p, 0}(z) - 1}{pz}.\]

**Proof.** These formulas are consequences of the following elementary identities:

\[\frac{1}{p-1} \binom{(n+1)p-1}{n+1} = \frac{1}{p} \binom{(n+1)p}{n+1} = \binom{np + p - 1}{n},\]

valid for $p \in \mathbb{R}$, $n = 0, 1, 2, \ldots$. \qed
It turns out that $D_{p,r}$ is related to the generating function
\[ B_p(z) := \sum_{n=0}^{\infty} \binom{np+1}{n} \frac{z^n}{np+1} \]
(2.5)
of the Fuss numbers. This function satisfies equation
\[ B_p(z) = 1 + z \cdot B_p(z)^p, \]
(2.6)
with the initial value $B_p(0) = 1$ (5.59 in Ref. 3), and Lambert’s formula:
\[ B_p(z)^r = \sum_{n=0}^{\infty} \binom{np+r}{n} \frac{r \cdot z^n}{np+r}. \]
(2.7)
Since
\[ D_{p,r}(z) = \frac{B_p(z)^{1+r}}{p - (p-1)B_p(z)} \]
(2.8)
(5.61 in Ref. 3), it is sufficient to study the functions $B_p$.

The simplest cases for $B_p$ are:
\begin{align*}
B_0(z) &= 1 + z, \\
B_1(z) &= \frac{1}{1 - z}, \\
B_{-1}(z) &= \frac{1 + \sqrt{1 + 4z}}{2}, \\
B_2(z) &= \frac{2}{1 + \sqrt{1 - 4z}}, \\
B_{1/2}(z) &= \frac{2 + z^2 + z\sqrt{4 + z^2}}{2},
\end{align*}
which lead to
\begin{align*}
D_{0,r}(z) &= (1 + z)^r, \\
D_{1,r}(z) &= (1 - z)^{-1-r}, \\
D_{-1,r}(z) &= \frac{(\frac{1 + \sqrt{1 + 4z}}{2})^{1+r}}{\sqrt{1 + 4z}}, \\
D_{2,r}(z) &= \frac{(\frac{2}{1 + \sqrt{1 - 4z}})^r}{\sqrt{1 - 4z}}, \\
D_{1/2,r}(z) &= \frac{4(2 + z^2 + z\sqrt{4 + z^2})^{1+r}}{4 + z^2 + z\sqrt{4 + z^2}}.
\end{align*}
These examples illustrate the following general rules:
\begin{align*}
B_p(z) &= B_{1-p}(-z)^{-1}, \quad (2.9) \\
D_{p,r}(z) &= D_{1-p,-1-r}(-z). \quad (2.10)
\end{align*}
The rest of this section is devoted to the cases $p = 3$ and $p = 3/2$. 

---

W. Miotkowski & K. A. Penson
2.1. The case \( p = 3 \)

First we find \( B_3 \).

**Proposition 2.2.** For \(|z| < 4/27\), we have

\[
B_3(z) = \frac{3}{3 \cos^2 \alpha - \sin^2 \alpha},
\]

where \( \alpha = \frac{1}{3} \arcsin(\sqrt{27z}/4) \).

Note that both the maps \( u \mapsto \cos^2(\frac{1}{3} \arcsin(u)) \) and \( u \mapsto \sin^2(\frac{1}{3} \arcsin(u)) \) are even, hence involve only even powers of \( u \) in their Taylor expansion. Therefore the functions \( u \mapsto \cos^2(\frac{1}{3} \arcsin(\sqrt{u})) \) and \( u \mapsto \sin^2(\frac{1}{3} \arcsin(\sqrt{u})) \) are well defined and analytic on the disc \(|u| < 1\).

**Proof.** First we note that

\[
\binom{3n+1}{n} \frac{1}{3n+1} = \frac{(3n)!}{(2n+1)!n!} = \frac{(\frac{1}{2})_n (\frac{2}{3})_n 3^{3n}}{\frac{3}{5}_n (\frac{5}{2})_n 2^{2n} \cdot n!},
\]

where \((a)_n := a(a+1) \cdots (a+n-1)\) is the Pochhammer symbol. This implies that

\[
B_3(z) = {}_2F_1\left(\frac{1}{3}, \frac{2}{3}; \frac{3}{2}; \frac{27z}{4}\right).
\]

Now, applying the identity

\[
{}_2F_1(a, 1-a; 3/2 | \sin^2 t) = \frac{\sin((2a-1)t)}{(2a-1) \sin t},
\]

(see 15.4.16 in Ref. 10 or p. 1029 in Ref. 12) with \( t = 3\alpha \) and \( a = 2/3 \), we get

\[
B_3(z) = \frac{3 \sin \alpha}{\sin 3\alpha} = \frac{3}{3 \cos^2 \alpha - \sin^2 \alpha}.
\]

Now we can give formula for \( D_{3, r} \).

**Corollary 2.1.** For all \( r \in \mathbb{R} \) we have

\[
D_{3, r}(z) = \left(\frac{3}{3 \cos^2 \alpha - \sin^2 \alpha}\right)^r \frac{1}{\cos^2 \alpha - 3 \sin^2 \alpha},
\]

where \( \alpha = \frac{1}{3} \arcsin(\sqrt{27z}/4) \), \(|z| < 27/4\).

Now we observe that \( D_{3, r}(z) \) and \( B_3(z)^r \) can also be expressed as hypergeometric functions.

**Proposition 2.3.** For all \( r \in \mathbb{R} \) and \(|z| < 4/27\) we have

\[
D_{3, r}(z) = {}_3F_2\left(\frac{1+r}{3}, \frac{2+r}{3}, \frac{3+r}{3}; \frac{1+r}{2}, \frac{2+r}{2}; \frac{27z}{4}\right),
\]

\[
B_3(z)^r = {}_3F_2\left(\frac{r}{3}, \frac{1+r}{3}, \frac{2+r}{3}; \frac{1+r}{2}, \frac{2+r}{2}; \frac{27z}{4}\right).
\]
Proof. It is easy to check that
\[
\binom{3n+r}{n} = \frac{(\frac{1+r}{2})_n(\frac{2+r}{2})_n(\frac{3+r}{2})_n}{n!}3^{3n+r}
\]
and
\[
\binom{3n+r}{3n+r} = \frac{(\frac{1+r}{2})_n(\frac{2+r}{2})_n(\frac{3+r}{2})_n}{n!}3^{3n+r}
\]
which leads to the statement.

As a by-product we obtain two hypergeometric identities:

**Corollary 2.2.** For \( a \in \mathbb{R}, |u| < 1 \) we have
\[
_{3}F_{2}\left( a, a + \frac{1}{3}, a + \frac{2}{3}; \frac{3a}{2}, \frac{3a + 1}{2}; \frac{u}{3} \right) = \frac{(\cos^{3} \alpha - \sin^{2} \alpha)^{a-1}}{\cos^{2} \alpha - 3 \sin^{2} \alpha}, \tag{2.15}
\]
\[
_{3}F_{2}\left( a, a + \frac{1}{3}, a + \frac{2}{3}; \frac{3a + 1}{2}, \frac{3a + 2}{2}; \frac{u}{3} \right) = \frac{3}{(3 \cos^{2} \alpha - \sin^{2} \alpha)^{a}}, \tag{2.16}
\]
where \( \alpha = \frac{1}{2} \arcsin \sqrt{u} \).

**Remark.** One can check that (2.15) and (2.16) are alternative versions of the following known formulas:
\[
_{3}F_{2}\left( a, a + \frac{1}{3}, a + \frac{2}{3}; \frac{3a}{2}, \frac{3a + 1}{2}; \frac{-27z}{4(1-z)^{3}} \right) = \frac{(1-z)^{a}}{2z + 1}, \tag{2.17}
\]
\[
_{3}F_{2}\left( a, a + \frac{1}{3}, a + \frac{2}{3}; \frac{3a + 1}{2}, \frac{3a + 2}{2}; \frac{-27z}{4(1-z)^{3}} \right) = (1-z)^{a} \tag{2.18}
\]
(7.4.1.28 and 7.4.1.29 in Ref. 13). Indeed, putting
\[
z = \frac{-4 \sin^{2} \alpha}{3 \cos^{2} \alpha - \sin^{2} \alpha}
\]
we have
\[
1 - z = \frac{3}{3 \cos^{2} \alpha - \sin^{2} \alpha},
\]
\[
\frac{-27z}{4(1-z)^{3}} = \sin^{2} \alpha(3 \cos^{2} \alpha - \sin^{2} \alpha)^{2} = \sin^{2} 3 \alpha
\]
and
\[
2z + 1 = \frac{3(\cos^{3} \alpha - \sin^{2} \alpha)}{3 \cos^{2} \alpha - \sin^{2} \alpha}.
\]

Let us mention here that the sequences \( \binom{3n-1}{n}, \binom{3n}{n}, \binom{3n+1}{n} \) and \( \binom{3n+2}{n} \) appear in OEIS as A165817, A005809, A045721 and A025174 respectively.
2.2. The case $p = 3/2$

First we compute $B_{3/2}$ in terms of hypergeometric functions.

**Lemma 2.1.**

$$ B_{3/2}(z) = 1 - 2F_1 \left( \frac{2}{3}, \frac{-1}{3}, \frac{-1}{3} \mid \frac{27z^2}{4} \right) + z \cdot 2F_1 \left( \frac{5}{6}, \frac{5}{6}, \frac{27z^2}{4} \right). $$

**Proof.** If $n = 2k$ then the coefficient at $z^n$ on the right-hand side is

$$ \frac{-(2)^{k+1}(1)^{k+1}3^{3k+3}}{3(2)^{k+1}(k+1)!2^{2k+2}} $$

$$ = \frac{(-2) \cdot 1 \cdot 4 \ldots \cdot (3k - 2) \cdot (-1) \cdot 2 \cdot 5 \ldots \cdot (3k - 1)3^{k+1}}{3(-1) \cdot 1 \cdot 3 \ldots \cdot (2k - 1)(k + 1)!2^{k+1}} $$

$$ = \frac{1 \cdot 4 \ldots \cdot (3k - 2) \cdot 2 \cdot 5 \ldots \cdot (3k - 1)3^k}{1 \cdot 3 \ldots \cdot (2k - 1)(k + 1)!2^k} $$

$$ = \frac{(3k)!}{(2k)!(k + 1)!} \cdot \frac{3k + 1}{2k} \cdot 1 \cdot \frac{3n/2 + 1}{3n/2 + 1} \cdot \frac{1}{n} \cdot \frac{3n/2 + 1}{3n/2 + 1}. $$

Now assume that $n = 2k + 1$. Then

$$ \left( \frac{3n/2 + 1}{n} \right) \frac{1}{3n/2 + 1} = \frac{(6k + 3)(6k + 1)(6k - 1) \ldots (2k + 5)}{2^{2k}(2k + 1)!} $$

$$ = \frac{(6k + 3)!!}{2^{2k}(2k + 3)!(2k + 1)!}. $$

On the other hand

$$ \left( \frac{3k}{2} \right)^{k} \left( \frac{3k}{2} \right)^{3k+3} \left( \frac{2^k}{2} \right)^{2k+1} $$

$$ = \frac{5 \cdot 11 \ldots \cdot (6k - 1) \cdot 7 \cdot 13 \ldots \cdot (6k + 1) \cdot 3^k}{5 \cdot 7 \ldots \cdot (2k + 3)2^{2k}!2^k} $$

$$ = \frac{(6k + 3)!!}{2^{2k}(2k + 3)!(2k + 1)!!2^k}. $$

Since $(2k + 1)!!2^k! = (2k + 1)!$, the proof is complete.

Now we find formulas for these two hypergeometric functions.

**Lemma 2.2.**

$$ 2F_1 \left( \frac{-2}{3}, \frac{-1}{3}, \frac{-1}{3} \mid \frac{u}{3} \right) = \frac{2}{3} \cos 2\beta + \frac{1}{3} \cos 4\beta, \quad (2.19) $$

$$ 2F_1 \left( \frac{5}{6}, \frac{5}{6}, \frac{5}{2} \mid \frac{u}{3} \right) = \frac{27 \cos \beta \sin^3 \beta}{\sin^3 3\beta}, \quad (2.20) $$

where $\beta = \frac{1}{2} \arcsin (\sqrt{u})$. 

1450014-7
Proof. We know\(^1\) that \( \, _2F_1(a, b; c \mid z) \) is the unique function \(f\) which is analytic at \( z = 0 \), with \( f(0) = 1 \), and satisfies the hypergeometric equation:

\[ z(1 - z)f''(z) + [c - (a + b + 1)]f'(z) - abf(z) = 0. \]

Now one can check that this equation is satisfied by the right-hand sides of (2.19) and (2.20) for given parameters \( a, b, c \).

Now we are ready to express \( B_{3/2} \) as an elementary function.

**Proposition 2.4.** For \( 3|z|\sqrt{3} < 2 \) we have

\[ B_{3/2}(z) = \frac{3}{(\sqrt{3} \cos \beta - \sin \beta)^2}, \]

where \( \beta = \frac{1}{3} \arcsin(3z\sqrt{3}/2) \).

**Proof.** In view of the previous lemmas we have

\[
B_{3/2}(z) = \frac{1 - \frac{3}{2} \cos 2\beta - \frac{1}{4} \cos 4\beta}{\frac{3}{2} \sin^2 3\beta} + \frac{2 \sin 3\beta 27 \cos \beta \sin^3 \beta}{3 \sqrt{3}} \sin^3 3\beta \\
= \frac{3(1 - \cos 2\beta)(2 + \cos 2\beta)}{2 \sin^2 3\beta} + \frac{6 \sqrt{3} \cos \beta \sin^3 \beta}{\sin^2 3\beta} \\
= \frac{3 \sin^2 \beta(3\cos^2 \beta + \sin^2 \beta + 2\sqrt{3} \cos \beta \sin \beta)}{\sin^2 3\beta} \\
= \frac{3(\sqrt{3} \cos \beta + \sin \beta)^2}{(3\cos^2 \beta - \sin^2 \beta)^2} \\
= \frac{3}{(\sqrt{3} \cos \beta - \sin \beta)^2}. \]

Now we provide formula for \( D_{3/2,r} \).

**Corollary 2.3.** For all \( r \in \mathbb{R} \) and \( 3|z|\sqrt{3} < 2 \) we have

\[ D_{3/2, r}(z) = \left( \frac{3}{(\sqrt{3} \cos \beta - \sin \beta)^2} \right)^r \frac{1}{\cos \beta(\cos \beta - \sqrt{3} \sin \beta)}. \]

where \( \beta = \frac{1}{3} \arcsin(3z\sqrt{3}/2) \).

Note also a hypergeometric expression for \( D_{3/2,r} \):

**Proposition 2.5.** For all \( r \in \mathbb{R} \) and \( 3|z|\sqrt{3} < 2 \) we have

\[
D_{3/2, r}(z) = \, _3F_2\left( \begin{array}{c} 1 + r, 2 + r, 3 + r \\ \frac{3}{3}, \frac{3}{3}, \frac{3}{3} \end{array} ; \frac{1}{2}, 1 + r \right| \frac{27z^2}{4} \right) \\
+ \frac{z(2r + 3)}{2} \, _3F_2\left( \begin{array}{c} 5 + 2r, 7 + 2r, 9 + 2r \\ 6, 6, 6, 3, 3 + 2r \end{array} ; \frac{27z^2}{4} \right). \]
the Mellin convolution product of modified beta distributions. If, in turn, \( n = 2k + 1 \) then the coefficient at \( z^n \) is
\[
\frac{(3 + 2r) \Gamma(\frac{3+2r}{2})}{\Gamma(\frac{3}{2}k+3/2)} = \frac{(3+2r)}{(2k+1)!}
\]
which proves the odd case and completes the proof.

3. Mellin Convolution

In this section we are going to prove that if \( p \geq 1 \) and \(-1 \leq r \leq p - 1\) then the sequence (1.1) is positive definite. Moreover, if \( p > 1 \) is rational and \(-1 < r < p - 1\) then the corresponding probability measure \( \nu(p, r) \) is absolutely continuous and is the Mellin convolution product of modified beta distributions.²

**Lemma 3.1.** If \( p = k/l \), where \( k, l \) are integers such that \( 1 \leq l < k \) and if \( r > -1 \), \( mp + r + 1 \neq 0, -1, -2, \ldots \), then
\[
\left( \begin{array}{c} mp + r \ \\ m \end{array} \right) = \frac{1}{\sqrt{2\pi l}} \Gamma \left( \frac{p}{p-1} \right) \frac{r^{r+1/2} \prod_{j=1}^{k} \Gamma(\beta_j + m/l)^{c(p)^m}}{\prod_{j=1}^{k} \Gamma(\alpha_j + m/l)^{c(p)}}, (3.1)
\]
m = 0, 1, 2, \ldots , where \( c(p) = p^p(p-1)^{1-p} \),
\[
\alpha_j = \begin{cases} \frac{j}{l} & \text{if } 1 \leq j \leq l, \\
\frac{r+j-l}{k-l} & \text{if } l+1 \leq j \leq k,
\end{cases} (3.2)
\]
\[
\beta_j = \frac{r+j}{k}, \quad 1 \leq j \leq k. (3.3)
\]
Writing \( p = k/l \) we will tacitly assume that \( k, l \) are relatively prime, although this assumption is not necessary in the sequel.
Proof. Assuming that \( mp + r + 1 \neq 0, -1, -2, \ldots \), we have
\[
\binom{mp + r}{m} = \frac{\Gamma(mp + r + 1)}{\Gamma(m + 1)\Gamma(mp - m + r + 1)}.
\] (3.4)

Now we apply Gauss’s multiplication formula:
\[
\Gamma(nz) = (2\pi)^{(1-n)/2}n^{nz-1/2} \prod_{i=0}^{n-1} \Gamma\left(z + \frac{i}{n}\right)
\] (3.5)

which gives us:
\[
\Gamma(mp + r + 1) = \Gamma\left(k\left(\frac{m}{l} + \frac{r + 1}{k}\right)\right)
\]
\[
= (2\pi)^{(1-k)/2}k\Gamma\left(\frac{m}{l} + \frac{r + j}{k}\right).
\]
\[
\Gamma(m + 1) = \Gamma\left(\frac{m}{l} + 1\right) = (2\pi)^{(1-l)/2}\Gamma\left(\frac{m}{l} + \frac{j}{l}\right).
\]
\[
\Gamma(mp - m + r + 1) = \Gamma\left((k-1)\left(\frac{m}{l} + \frac{r + 1}{k-l}\right)\right)
\]
\[
= (2\pi)^{(1-k+l)/2}(k-1)\Gamma\left(\frac{m}{l} + \frac{r + j - l}{k-l}\right).
\]

Applying to (3.4) we get (3.1).

Similarly as in Ref. 7 we need to change the enumeration of \( \alpha \)'s. Note that here this modification depends not only on \( k, l \) but also on \( r \).

Lemma 3.2. Suppose that \( k, l \) are integers such that \( 1 \leq l < k \) and that \( -1 < r \leq p - 1 = (k-l)/l \). For \( 1 \leq i \leq l \) define
\[
\tilde{\alpha}_i := \left\lfloor \frac{ik}{l} - r \right\rfloor,
\] where \( \lfloor \cdot \rfloor \) denotes the floor function. In addition we put \( \tilde{\alpha}_0 := 0 \) and \( \tilde{\alpha}_{i+1} := k + 1 \), so that
\[
0 = \tilde{\alpha}_0 < \tilde{\alpha}_1 < \tilde{\alpha}_2 < \cdots < \tilde{\alpha}_l \leq k < k + 1 = \tilde{\alpha}_{l+1}.
\]

For \( 1 \leq j \leq k \) define
\[
\tilde{\alpha}_j = \begin{cases} 
  \frac{i}{l} & \text{if } j = \tilde{\alpha}_i, \ 1 \leq i \leq l, \\
  \frac{r + j - l}{k-l} & \text{if } \tilde{\alpha}_i < j < \tilde{\alpha}_{i+1}.
\end{cases}
\] (3.6)

Then \( \{\tilde{\alpha}_j\}_{j=1}^{k} \) is a permutation of \( \{\alpha_j\}_{j=1}^{k} \) and we have \( \beta_j \leq \tilde{\alpha}_j \) for all \( j \leq k \).
Proof. If $j = j'$, $1 \leq i \leq l$, then we have to prove that
\[ \frac{r + j'}{k} \leq \frac{i}{l}, \]
which is equivalent to
\[ j' \leq \frac{ik}{l} - r, \]
but this is a consequence of the definition of $j'$ and the inequality $\lfloor x \rfloor \leq x$.

Now assume that $j' < j < j' + 1$, $0 \leq i \leq k$. Then we should prove that
\[ \frac{r + j}{k} \leq \frac{r + j - i}{k - l}, \]
which is equivalent to
\[ lr + lj - ik \geq 0. \]
Since $\lfloor x \rfloor + 1 > x$, we have
\[ lr + lj - ik \geq lr + l(j' + 1) - ik > lr + l \left( \frac{ik}{l} - r \right) - ik = 0, \]
which concludes the proof. \qed

Recall that for probability measures $\mu_1, \mu_2$ on the positive half-line $[0, \infty)$ the Mellin convolution (or the Mellin product) is defined by
\[ (\mu_1 \circ \mu_2)(A) := \int_0^\infty \int_0^\infty 1_A(xy) d\mu_1(x) d\mu_2(y) \quad (3.7) \]
for every Borel set $A \subseteq [0, \infty)$. This is the distribution of the product $X_1 \cdot X_2$ of two independent nonnegative random variables with $X_i \sim \mu_i$. In particular, $\mu \circ \delta_c$ is the dilation of $\mu$:
\[ (\mu \circ \delta_c)(A) = D_c \mu(A) := \mu \left( \frac{1}{c} A \right) \]
$(c > 0)$. If $\mu$ has density $f(x)$ then $D_c(\mu)$ has density $f(x/c)/c$.

If both the measures $\mu_1, \mu_2$ have all moments
\[ s_m(\mu_i) := \int_0^\infty x^m d\mu_i(x) \]
finite then so has $\mu_1 \circ \mu_2$ and
\[ s_m(\mu_1 \circ \mu_2) = s_m(\mu_1) \cdot s_m(\mu_2) \]
for all $m$.

If $\mu_1, \mu_2$ are absolutely continuous, with densities $f_1, f_2$ respectively, then so is $\mu_1 \circ \mu_2$ and its density is given by the Mellin convolution:
\[ (f_1 \circ f_2)(x) := \int_0^\infty f_1(x/y) f_2(y) \frac{dy}{y}. \]
We will apply the modified beta distributions:\textsuperscript{2,7}

\[
b(u + v, u, l) := \frac{1}{B(u, v)} x^{u-1} (1 - x^l)^{v-1} dx, \quad x \in [0, 1],
\]

(3.8)

where \(u, v, l > 0\) and \(B\) is the Euler beta function. The \(n\)th moment of \(b(u + v, u, l)\) is

\[
\int x^n d b(u + v, u, l)(x) = \frac{\Gamma(u + n/l) \Gamma(u + v)}{\Gamma(u + v + n/l) \Gamma(u)}.
\]

We also put \(b(u, u, l) := \delta_1\) for \(u, l > 0\).

Now we are ready to prove.

**Theorem 3.1.** Suppose that \(p = k/l\), where \(k, l\) are integers such that \(1 \leq l < k\), and that \(r\) is a real number, \(-1 < r \leq p - 1\). Then there exists a unique probability measure \(\nu(p, r)\) such that \(\binom{mp + r}{m}\) is its moment sequence. Moreover, \(\nu(p, r)\) can be represented as the following Mellin convolution:

\[
\nu(p, r) = b(\tilde{\alpha}_1, \beta_1, l) \circ \cdots \circ b(\tilde{\alpha}_k, \beta_k, l) \circ \delta_{c(p)},
\]

where \(c(p) := p^p (p - 1)^{1-p}\). In particular, \(\nu(p, r)\) is absolutely continuous and its support is \([0, c(p)]\).

The density function of \(\nu(p, r)\) will be denoted by \(V_{p,r}(x)\).

**Proof.** In view of Lemmas 3.1 and 3.2 we can write

\[
\binom{mp + r}{m} = D \prod_{j=1}^{k} \frac{\Gamma(\beta_j + m/l) \Gamma(\tilde{\alpha}_j)}{\Gamma(\tilde{\alpha}_j + m/l) \Gamma(\beta_j)} \cdot c(p)^m
\]

for some constant \(D\). Taking \(m = 0\) we see that \(D = 1\).

**Example.** Assume that \(p = 2\). If \(-1 < r \leq 0\) then

\[
\nu(2, r) = b \left( r + 1, \frac{r + 1}{2}, 1 \right) \circ b \left( 1, \frac{r + 2}{2}, 1 \right) \circ \delta_4,
\]

(3.9)

and if \(0 \leq r \leq 1\) then

\[
\nu(2, r) = b \left( 1, \frac{r + 1}{2}, 1 \right) \circ b \left( r + 1, \frac{r + 2}{2}, 1 \right) \circ \delta_4.
\]

(3.10)

**Theorem 3.2.** Suppose that \(p, r\) are real numbers, \(p \geq 1\) and \(-1 \leq r \leq p - 1\). Then there exists a unique probability measure \(\nu(p, r)\), with support contained in \([0, c(p)]\), such that \(\{\binom{mp + r}{m}\}_{m=0}^{\infty}\) is its moment sequence.

**Proof.** This follows from the fact that the class of positive definite sequences is closed under pointwise limits. \(\square\)
Recall that if \( \{s_n\}_{n=0}^\infty \) is positive definite, i.e. is the moment sequence of a probability measure \( \mu \) on \( \mathbb{R} \), then \( \{(-1)^n s_n\}_{n=0}^\infty \) is the moment sequence of the reflection \( \hat{\mu} \) of \( \mu \): \( \hat{\mu}(X) := \mu(-X) \). For the binomial sequence we have:

\[
\left( \begin{array}{c} np + r \\ n \end{array} \right) (-1)^n = \left( \begin{array}{c} n(1-p) - 1 - r \\ n \end{array} \right)
\]

(3.11)

which in particular implies (2.10)), hence if the binomial sequence (1.1), with parameters \( (p, r) \), is positive definite then it is also positive definite for parameters \( (1-p, -1-r) \) and we have

\[
\nu(1-p, -1-r) = \hat{\nu}(p, r).
\]

(3.12)

Therefore, if either \( p \geq 1 \), \(-1 \leq r \leq p - 1 \) or \( p \leq 0 \), \(-p - 1 \leq r \leq 0 \) then the binomial sequence (1.1) is positive definite (for illustration see Fig. 1). We will see in Theorem 7.1 that the opposite implication is also true.

Let us also note relations between the measures \( \nu(p, -1) \), \( \nu(p, 0) \), \( \nu(p, p-1) \) and observe that \( \nu(p, -1) \) has an atomic part.

**Proposition 3.1.** For \( p \geq 1 \) we have

\[
\nu(p, -1) = \frac{1}{p} \delta_0 + \frac{p-1}{p} \nu(p, 0),
\]

(3.13)

\[
d\nu(p, p-1)(x) = \frac{x}{p} d\nu(p, 0)(x).
\]

(3.14)

Fig. 1. The set of pairs \( (p, r) \) for which the binomial sequence \( \left( \begin{array}{c} np + r \\ n \end{array} \right) \) is positive definite, see Theorems 3.2 and 7.1. The vertical line at \( p = 2 \) and the dots indicate those parameters \( (p, r) \) for which the density \( V_{p,r} \) is an elementary function, see Corollary 4.2, Theorems 5.1 and 5.2.
Proof. Both formulas follow directly from (2.4): for \( n \geq 1 \) we have
\[
\binom{np-1}{n} = \frac{p-1}{p} \binom{np}{n} = \frac{p-1}{p} \int_0^x x^n \mu(p,0)(x)
\]
and for \( n \geq 0 \)
\[
\binom{np + p - 1}{n} = \frac{1}{p} \binom{(n+1)p}{n+1} = \frac{1}{p} \int_0^x x^n x \mu(p,0)(x).
\]

4. Applying Meijer G-Function

We know already that if \( p > 1 \) is a rational number and \(-1 < r \leq p - 1\) then \( \nu(p,r) \) is absolutely continuous. The aim of this section is to describe the density function \( V_{p,r} \) of \( \nu(p,r) \) in terms of the Meijer G-function\(^{10}\) and consequently, as a linear combination of generalized hypergeometric functions. We will see that in some particular cases \( V_{p,r} \) can be represented as an elementary function.

Lemma 4.1. For \( p > 1 \) and \( r \in \mathbb{R} \) define complex function
\[
\psi_{p,r}(\sigma) = \frac{\Gamma((\sigma - 1)p + r + 1)}{\Gamma(\sigma)\Gamma((\sigma - 1)(p - 1) + r + 1)},
\]
where for critical \( \sigma \) the right-hand side is understood as the limit if it exists. Then, putting \(-N_0 := \{0, -1, -2, \ldots\} \), we have
\[
\psi_{p,r}(n + 1) = \begin{cases} 
\frac{(np + r)}{n} & \text{if } np + r + 1 \notin -N_0, \\
\frac{p-1}{p} \frac{(np + r)}{n} & \text{if } np + r + 1 \in -N_0.
\end{cases}
\]

Proof. If \( np + r + 1 \notin -N_0 \), then the statement is a consequence of the equality \( \Gamma(z + 1) = z\Gamma(z) \). Now recall that for the reciprocal gamma function we have
\[
\frac{d}{dx} \frac{1}{\Gamma(x)} \bigg|_{x=-m} = (-1)^m m!,
\]
for \( m \in N_0 \) (see formula (3.30) in Ref. 5). Therefore, if \( np + r + 1 = -N \), with \( N \in N_0 \), then
\[
\lim_{\sigma \to n+1} \psi_{p,r}(\sigma) = \frac{(p-1)(N+n)!(-1)^{N+n}}{pm!N!(1-1)^N} = \frac{p-1}{p} \binom{N+n}{n} (-1)^n = \frac{p-1}{p} \binom{np+r}{n},
\]
where we used the identity \( \binom{n}{m} = \binom{n-m-1}{n-1}(-1)^n \).
Note two identities which the functions $\psi_{p,r}$ satisfy:

$$\psi_{p,-1}(\sigma) = \frac{p-1}{p} \psi_{p,0}(\sigma), \quad (4.4)$$

$$\psi_{p,p-1}(\sigma) = \frac{1}{p} \psi_{p,0}(\sigma + 1). \quad (4.5)$$

For $p > 1$ and $r \in \mathbb{R}$ we define function $V_{p,r}(x)$ as the inverse Mellin transform of $\psi_{p,r}(\sigma)$:

$$V_{p,r}(x) = \frac{1}{2\pi i} \int_{d-i\infty}^{d+i\infty} x^{-\sigma} \psi_{p,r}(\sigma) \, d\sigma \quad (4.6)$$

whenever exists. Then (4.4) and (4.5) imply

$$V_{p,-1}(x) = \frac{p-1}{p} V_{p,0}(x), \quad (4.7)$$

$$V_{p,p-1}(x) = \frac{x}{p} V_{p,0}(x). \quad (4.8)$$

It turns out that if $p > 1$ is rational, $r \in \mathbb{R}$, then $V_{p,r}$ exists and can be expressed as Meijer function.

**Theorem 4.1.** Let $p = k/l > 1$, where $k,l$ are integers such that $1 \leq l < k$, and let $r \in \mathbb{R}$. Then $V_{p,r}$ exists and can be expressed as

$$V_{p,r}(x) = \frac{p^{r+1/2} \sqrt{\pi}^r}{x^{p-1)}^{r+1/2} 2\pi^l} G_{k,k}^{k,k} \left( \frac{x^l}{c(p)^l} \left| \begin{array}{c} \alpha_1, \ldots, \alpha_k \\ \beta_1, \ldots, \beta_k \end{array} \right. \right), \quad (4.9)$$

$x \in (0, c(p))$, where $c(p) = p^p (p-1)^{1-p}$ and the parameters $\alpha_j, \beta_j$ are given by (3.2) and (3.3). Moreover, $\psi_{p,r}$ is the Mellin transform of $V_{p,r}$, i.e. we have

$$\psi_{p,r}(\sigma) = \int_0^{c(p)} x^{\sigma-1} V_{p,r}(x) \, dx, \quad (4.10)$$

for $\Re \sigma > 1 - \frac{1+r}{p}$.

**Proof.** Putting $m = \sigma - 1$ in (3.1) we get

$$\psi_{p,r}(\sigma) = \frac{(p-1)^{p-r-3/2} \prod_{j=1}^k \Gamma(\beta_j + \sigma/l - 1/l)}{p^{p-r-1/2} \sqrt{2\pi}^l \prod_{j=1}^k \Gamma(\alpha_j + \sigma/l - 1/l)} c(p)^\sigma. \quad (4.11)$$

Writing the right-hand side as $\Psi((\sigma/l - 1/l)c(p)^\sigma$, using the substitution $\sigma = lu + 1$ and the definition of the Meijer G-function we obtain

$$V_{p,r}(x) = \frac{1}{2\pi i} \int_{d-i\infty}^{d+i\infty} \Psi((\sigma/l - 1/l)c(p)^\sigma x^{-\sigma} \, d\sigma$$

$$= \frac{\Gamma(c(p))}{2\pi i} \int_{d-i\infty}^{d+i\infty} \Psi(u) (x^l/c(p)^l)^{-u} \, du$$

$$= \left( \frac{p-1}{z^{1/p}} \right)^{p-r-3/2} \sqrt{\pi}^r 2\pi \frac{G_{k,k}^{k,k}}{z^{1/p} p^{p-r-1/2}} \left( \begin{array}{c} z \\ \beta_1, \ldots, \beta_k \end{array} \right) = \tilde{V}_{p,r}(x).$$

1450014-15
$z = x^l/c(p)^l$, which leads to (4.9). Recall that for the existence of the Meijer function of type $C_{k,k}^{k,0}$ there is no restriction on the parameters $\alpha_j, \beta_j$.

On the other hand, since $\sum_{j=1}^k (\beta_j - \alpha_j) = -1/2 < 0$, we can apply formula 2.24.2.1 from Ref. 13. Substituting $x := c(p)z^{1/l}$ we have

$$
\int_0^c x^{\sigma-1} V_{p,r}(x) dx = \frac{c(p)^\sigma}{l} \int_0^1 z^{\sigma/l-1} V_{p,r}(z) dz
$$

$$
= \frac{(p-1)p^{r-3/2}}{p^{p-r-1/2}2\pi^l}c(p)^\sigma \int_0^1 z^{\sigma/l-1} C_{k,k}^{k,0}(z | a_1, \ldots, a_k) dz
$$

$$
= \psi_{p,r}(\sigma).
$$

In view of the assumptions for the formula 2.24.2.1 in Ref. 13, the last equality holds provided $\Re(\sigma/l-1/l) > -\min_j \beta_j = -(1+r)/k$.

Now we are able to describe the measures $\nu(p, r)$ for rational $p$.

**Corollary 4.1.** Assume that $p = k/l$, where $k, l$ are integers, and $1 \leq l < k$. If $-1 < r \leq p - 1$ then the probability measure $\nu(p, r)$ is absolutely continuous and $V_{p,r}$ is the density function, i.e.

$$
\nu(p, r) = V_{p,r}(x) dx, \quad x \in (0, c(p)).
$$

For $r = -1$ we have

$$
\nu(p, -1) = \frac{1}{p} b_0 + V_{p,-1}(x) dx, \quad x \in (0, c(p)).
$$

**Proof.** This is a consequence of Theorem 3.1, (4.10), the uniqueness part of the Riesz representation theorem for linear functionals on $C[0, c(p)]$ and of the Weierstrass approximation theorem.

Now applying Slater’s theorem$^5$, we can represent $V_{p,r}$ as a linear combination of generalized hypergeometric functions.

**Theorem 4.2.** For $p = k/l$, with $1 \leq l < k$, $r \in \mathbb{R}$ and $x \in (0, c(p))$ we have

$$
V_{p,r}(x) = \gamma(k,l,r) \sum_{h=1}^k c(h,k,l,r) F_{k-1} \begin{pmatrix} a(h,k,l,r) \\ b(h,k) \end{pmatrix} z^{(r+h)/k-1/l}, \quad (4.13)
$$

where $z = x^l/c(p)^l$,

$$
\gamma(k,l,r) = \frac{l(p-1)^{p-r-1}}{p^{p-r-1/2}2\pi^l(k-l)}, \quad (4.14)
$$

$$
c(h,k,l,r) = \frac{\prod_{j=1}^{h-1} \Gamma(\frac{r-h}{k}) \prod_{j=h+1}^k \Gamma(\frac{r-h}{k})}{\prod_{j=1}^{l+1} \Gamma(\frac{r-h}{k}) \prod_{j=l+1}^k \Gamma(\frac{r-h}{k})}, \quad (4.15)
$$
and the parameter vectors of the hypergeometric functions are

\[ a(h, k, l, r) = \left( \begin{array}{l} \frac{r + h - j - l}{k} \\
\frac{r + h - r - j - k}{k - l} \end{array} \right)_{j=1}^{l}, \left( \begin{array}{l} \frac{r + h - j}{k} \\
\frac{r + h - r - j}{k - 1} \end{array} \right)_{j=l+1}, \quad (4.16) \]

\[ b(h, k) = \left( \begin{array}{l} \frac{k + h - j}{k} \end{array} \right)_{j=1}^{h-1}, \left( \begin{array}{l} \frac{r + h - j}{k} \end{array} \right)_{j=h+1}. \quad (4.17) \]

**Proof.** It is easy to check that if \( i \neq j \) then the difference \( \beta_i - \beta_j \) of coefficients (3.3) is not an integer and the Slater’s formula is applicable. \( \square \)

Let us note a simpler expression for the coefficient \( c(h, k, l, r) \).

**Proposition 4.1.** We have

\[ c(h, k, l, r) = \frac{\sqrt{2}(p - 1)^{(r + h) / p - h + 1 / 2}}{(-1)^{h-1}p^{1/2-h} \sqrt{\pi}} \left( \frac{r + h}{p} - 1 \right) \sin \left( \frac{r + h}{p} \pi \right). \quad (4.18) \]

**Proof.** Using Gauss’s multiplication formula (3.5) we have

\[ \prod_{j=1 \atop j \neq h}^{k} \Gamma \left( \frac{j - h}{k} \right) = \lim_{z \to h} \prod_{j=1 \atop j \neq h}^{k} \Gamma \left( \frac{j - z}{k} \right) \]

\[ = \lim_{z \to h} \prod_{j=1}^{k} \frac{\Gamma(\frac{j - z}{k})}{\Gamma(h - z)} = \lim_{z \to h} \prod_{i=0}^{k-1} \frac{\Gamma(\frac{i + 1}{k} - \frac{r + h}{p} - 1)}{\Gamma(h - z)} \]

\[ = \lim_{z \to h} \frac{(2\pi)^{(k-1)/2} k^{-1/2} \Gamma(1 - z)}{\Gamma(h - z)} = \frac{(2\pi)^{(k-1)/2} k^{-1/2} (-1)^{h-1}}{k \cdot (h - 1)!}. \]

In the last equality we applied l’Hôpital’s rule together with (4.3).

Now we compute the terms in the denominator:

\[ \prod_{j=1}^{l} \Gamma \left( \frac{j - r + h}{k} \right) = \prod_{i=0}^{l-1} \frac{\Gamma \left( \frac{i + 1}{l} - \frac{r + h}{k} \right)}{\Gamma \left( \frac{r + h}{p} \right)} \]

\[ = (2\pi)^{(l-1)/2} l^{r+h}/p - 1/2 \Gamma \left( 1 - \frac{r + h}{p} \right) \]

and

\[ \prod_{j=l+1}^{k} \Gamma \left( \frac{r + j - l - r + h}{k - l} - \frac{r + h}{k} \right) = \prod_{i=0}^{k-l-1} \frac{\Gamma \left( \frac{r + i + 1}{k - l} - \frac{r + h}{k} \right)}{\Gamma \left( \frac{r + h}{p} - h + 1 \right)}. \]
Therefore, from a version of Euler’s reflection formula:
\[
\Gamma(1 - z)\Gamma(z) = \pi \frac{\pi}{(z - 1)(z - 2) \cdots (z - k) \sin(\pi z)}
\]
we have
\[
c(h, k, l, r) = \frac{(-1)^{h-1} \sqrt{\pi}^{h-3/2}((\frac{r}{p} - h - 1) \cdots ((\frac{r}{p} - h + 1)) \sin(\frac{r}{p} \pi)}
\]
\[
\sqrt{2^{(r+k)/p - 1/2}}(k-1)^{h-(r+k)/p - 1/2}(h-1)!
\]
which leads to (4.18).

The easiest case is \( p = 2 \).

**Corollary 4.2.** For \( p = 2, r \in \mathbb{R} \) we have
\[
V_{2,r}(x) = \frac{\cos(r \cdot \arccos \sqrt{x/4})}{\pi \sqrt{x^{4-r}(4-x)}},
\] (4.19)
\( x \in (0, 4). \) In particular
\[
V_{2,0}(x) = \frac{1}{\pi \sqrt{x(4-x)}},
\] (4.20)
\[
V_{2,-1/2}(x) = \frac{1}{2\pi} \sqrt{\frac{\sqrt{x} + 2}{\sqrt{x(4-x)}}},
\] (4.21)
\[
V_{2,1/2}(x) = \frac{1}{2\pi} \sqrt{\frac{\sqrt{x} + 2}{\sqrt{x(4-x)}}},
\] (4.22)
\[
V_{2,1}(x) = \frac{1}{2\pi} \sqrt{\frac{4-x}{x}}.
\] (4.23)

The density \( V_{2,0} \) gives the *arcsine distribution* \( \nu(2, 0). \) Note that if \( |r| > 1 \) then \( V_{2,r}(x) < 0 \) for some values of \( x \in (0, 4). \)

**Proof.** We take \( k = 2, l = 1 \) so that \( c(2) = 4, z = x/4 \) and
\[
\gamma(2, 1, r) = \frac{2r}{4 \sqrt{\pi}}
\]
Using the Euler’s reflection formula, and the identity \( \Gamma(1 + r/2) = \Gamma(r/2)r/2, \) we get
\[
c(1, 2, 1, r) = \frac{\Gamma(1/2)}{\Gamma((1 - r)/2)\Gamma((1 + r)/2)} = \frac{\cos(\pi r/2)}{\sqrt{\pi}},
\]
\[
c(2, 2, 1, r) = \frac{\Gamma(-1/2)}{\Gamma(-r/2)\Gamma(r/2)} = \frac{r \sin(\pi r/2)}{\sqrt{\pi}}.
\]
We also need formulas for two hypergeometric functions, namely

\[
\begin{align*}
2F_1 \left( \frac{1 + r}{2}, 1 - \frac{r}{2}; \frac{1}{2}; z \right) &= \frac{\cos(r \arcsin \sqrt{z})}{\sqrt{1 - z}}, \\
2F_1 \left( \frac{2 + r}{2}, 2 - \frac{r}{2}; \frac{3}{2}; z \right) &= \frac{\sin(r \arcsin \sqrt{z})}{r \sqrt{z(1 - z)}},
\end{align*}
\]

see 7.3.1.90 and 7.3.1.94 in Ref. 13. Now we can write

\[
V_{2,r}(x) = \frac{2^r \cos(r \pi/2) \cos(r \arcsin \sqrt{z}) z^{(r-1)/2}}{4\pi \sqrt{1 - z}} + \frac{2^r \sin(r \pi/2) \sin(r \arcsin \sqrt{z}) z^{r/2}}{4\pi \sqrt{z(1 - z)}}
\]

\[
= \frac{2^r z^{(r-1)/2}}{4\pi \sqrt{1 - z}} \cos(r \pi/2 - r \arcsin \sqrt{z})
\]

\[
= \frac{x^{(r-1)/2} \cos(r \arccos \sqrt{z})}{\pi \sqrt{4 - x}}
\]

which concludes the proof of the main formula. For the particular cases we use the identity: \( \cos \left( \frac{1}{2} \arccos(t) \right) = \sqrt{(t + 1)/2} \).

**Remark.** Observe that

\[
\frac{V_{2,0}(\sqrt{x})}{2 \sqrt{x}} = \frac{1}{4} V_{2,-1/2} \left( \frac{x}{4} \right).
\]

It means that if \( X, Y \) are random variables such that \( X \sim \nu(2, 0) \) and \( Y \sim \nu(2, -1/2) \) then \( X^2 \sim 4Y \). This can also be derived from the relation \((2n^{-1/2})4^n = \binom{2n}{n}\) (sequence A001448 in OEIS). Note also, that if \( Z \sim \mu(2, 1) \), the Marchenko–Pastur law \( \frac{1}{2\pi} \sqrt{4 - x} \) \( dx \), then \( 4 - Z \sim \nu(2, 1) \).

From (3.13) we obtain

**Corollary 4.3.**

\[

\nu(2, -1) = \frac{1}{2} \delta_0 + \frac{1}{2\pi \sqrt{x(4 - x)}} \chi_{(0,4)}(x) dx.
\]

5. Some Special Cases for \( p = 3 \) and \( p = 3/2 \)

From now on we are going to study some special cases for \( k = 3 \), i.e. for \( p = 3 \) and \( p = 3/2 \). Then in formula (4.13) we have three hypergeometric functions of type \( 3F_2 \) with lower parameters

\[
b(1, 3) = \left( \frac{1}{3}, \frac{2}{3} \right), \quad b(2, 3) = \left( \frac{2}{3}, \frac{4}{3} \right), \quad b(3, 3) = \left( \frac{4}{3}, \frac{5}{3} \right).
\]
For particular choices of $r$ these hypergeometric functions reduce to the type $\, _2F_1$, belonging to the following one-parameter family:

$$\, _2F_1\left(\frac{t}{2}, \frac{t+1}{2}; t \mid z\right) = \frac{(1 + \sqrt{1 - z})^{t-1}}{2^{t-1} \sqrt{1 - z}}$$  \hspace{1cm} (5.1)$$

(see formula 15.4.18 in Ref. 10).

Let us start with $p = 3$.

**Theorem 5.1.** For $p = 3$ we have

$$V_{3,0}(x) = \frac{(1 + \sqrt{1 - z})^{1/3}}{9\pi \sqrt{3(1 - z)}} z^{-2/3} + \frac{(1 + \sqrt{1 - z})^{-1/3}}{9\pi \sqrt{3(1 - z)}} z^{-1/3},$$

$$V_{3,1}(x) = \frac{(1 + \sqrt{1 - z})^{2/3}}{6\pi \sqrt{3(1 - z)}} z^{-1/3} + \frac{(1 + \sqrt{1 - z})^{-2/3}}{6\pi \sqrt{3(1 - z)}} z^{1/3},$$

$$V_{3,2}(x) = \frac{(1 + \sqrt{1 - z})^{1/3}}{4\pi \sqrt{3(1 - z)}} z^{1/3} + \frac{(1 + \sqrt{1 - z})^{-1/3}}{4\pi \sqrt{3(1 - z)}} z^{2/3},$$

where $z = 4x/27$ and $x \in (0, 27/4)$.

**Proof.** We have $c(3) = 27/4$ and

$$\gamma(3, 1, r) = \frac{2^{1-r}}{3^{5/2-r} \sqrt{\pi}},$$

$$c(1, 3, 1, r) = \frac{2^{(r+1)/3} \sin(\pi(1+r)/3)}{\sqrt{3\pi}},$$

$$c(2, 3, 1, r) = \frac{2^{(r-1)/3}(1-r) \sin(\pi(1-r)/3)}{\sqrt{3\pi}},$$

$$c(3, 3, 1, r) = \frac{2^{(r-6)/3}(3-r) r \sin(\pi r/3)}{\sqrt{3\pi}},$$

and the upper parameters for the hypergeometric functions are

$$a(1, 3, 1, r) = \left(\frac{1+r}{3}, \frac{5-r}{6}, \frac{2-r}{6}\right),$$

$$a(2, 3, 1, r) = \left(\frac{2+r}{3}, \frac{7-r}{6}, \frac{4-r}{6}\right),$$

$$a(3, 3, 1, r) = \left(\frac{3+r}{3}, \frac{9-r}{6}, \frac{6-r}{6}\right).$$

For $r = 0$ we have $c(3, 3, 1, 0) = 0$ and

$$V_{3,0}(x) = \frac{2}{9\sqrt{3\pi}} \left(\frac{2^{1/3} (1 + \sqrt{1 - z})^{1/3}}{2 \sqrt{\pi} \sqrt{1 - z}} z^{-2/3} + \frac{2^{-1/3} (1 + \sqrt{1 - z})^{-1/3}}{2 \sqrt{\pi} (2 - 1/3 \sqrt{1 - z})} z^{-1/3}\right)$$

$$= \frac{(1 + \sqrt{1 - z})^{1/3}}{9\pi \sqrt{3(1 - z)}} z^{-2/3} + \frac{(1 + \sqrt{1 - z})^{-1/3}}{9\pi \sqrt{3(1 - z)}} z^{-1/3}.$$
For $r = 1$ the second term vanishes and

$$V_{3,1}(x) = \frac{1}{3\sqrt{3\pi}} \left( \frac{2^{2/3} (1 + \sqrt{1-z})^{2/3}}{2\sqrt{\pi}} z^{-1/3} + \frac{2^{-5/3} (1 + \sqrt{1-z})^{-2/3}}{2^{-2/3} \sqrt{\pi}} z^{1/3} \right),$$

$$= \frac{(1 + \sqrt{1-z})^{2/3}}{6\pi \sqrt{3(1-z)}} z^{-1/3} + \frac{(1 + \sqrt{1-z})^{-2/3}}{6\pi \sqrt{3(1-z)}} z^{1/3}.$$

Finally, for the third formula we can apply (3.14), which gives us $V_{3,2}(x) = \frac{2}{\pi} V_{3,0}(x).

Similarly we work with $p = 3/2$.

**Theorem 5.2.** For $p = 3/2$ we have

$$V_{3/2,-1/2}(x) = \frac{(1 + \sqrt{1-z})^{2/3}}{3\pi \sqrt{3(1-z)}} z^{-1/3} + \frac{(1 + \sqrt{1-z})^{-2/3}}{3\pi \sqrt{3(1-z)}} z^{1/3},$$

$$V_{3/2,0}(x) = \frac{(1 + \sqrt{1-z})^{1/3}}{3\pi \sqrt{1-z}} z^{-1/6} + \frac{(1 + \sqrt{1-z})^{-1/3}}{3\pi \sqrt{1-z}} z^{1/6},$$

$$V_{3/2,1/2}(x) = \frac{(1 + \sqrt{1-z})^{1/3}}{\pi \sqrt{3(1-z)}} z^{1/3} + \frac{(1 + \sqrt{1-z})^{-1/3}}{\pi \sqrt{3(1-z)}} z^{2/3},$$

where $z = 4x^2/27, x \in (0, \sqrt{27/4})$.

**Proof.** We have $c(3/2) = \sqrt{27}/2$,

$$\gamma(3, 2, r) = \frac{2 \cdot 3^r}{3\sqrt{\pi}},$$

$$c(1, 3, 2, r) = \frac{\gamma(1-2r)/3 \sin(\pi(1-2r)/3)}{\sqrt{3\pi}},$$

$$c(2, 3, 2, r) = \frac{\gamma(-1-2r)/3(1+2r) \sin(\pi(1+2r)/3)}{\sqrt{3\pi}},$$

$$c(3, 3, 2, r) = \frac{\gamma(-3-2r)/3(3+2r) \sin(2\pi r/3)}{\sqrt{3\pi}}$$

and

$$a(1, 3, 2, r) = \left( \frac{5 + 2r}{6}, \frac{1 + r}{3}, \frac{1 - 2r}{3} \right),$$

$$a(2, 3, 2, r) = \left( \frac{7 + 2r}{6}, \frac{2 + r}{3}, \frac{2 - 2r}{3} \right),$$

$$a(3, 3, 2, r) = \left( \frac{9 + 2r}{6}, \frac{3 + r}{3}, \frac{3 - 2r}{3} \right).$$
For $r = -1/2$ the second term vanishes and we have
\[ V_{3/2,-1/2}(x) = \frac{2}{3\sqrt{3\pi}} \left( \frac{2^{2/3}}{\sqrt{2\pi}} \frac{(1 + \sqrt{1 - z})^{2/3}}{2^{2/3}\sqrt{1-z}^z} z^{-1/3} + \frac{2^{-2/3}}{\sqrt{2\pi}} \frac{(1 + \sqrt{1 - z})^{-2/3}}{2^{-2/3}\sqrt{1-z}^z} z^{1/3} \right) \]
\[ = \frac{(1 + \sqrt{1 - z})^{2/3}}{3\pi\sqrt{3(1-z)}} z^{-1/3} + \frac{(1 + \sqrt{1 - z})^{-2/3}}{3\pi\sqrt{3(1-z)}} z^{1/3}. \]

For $r = 0$ we note that $c(3, 3, 2, 0) = 0$ and we get
\[ V_{3/2,0}(x) = \frac{2}{3\sqrt{3\pi}} \left( \frac{2^{1/3}}{\sqrt{2\pi}} \frac{(1 + \sqrt{1 - z})^{1/3}}{2^{1/3}\sqrt{1-z}^z} z^{-1/6} + \frac{2^{-1/3}}{\sqrt{2\pi}} \frac{(1 + \sqrt{1 - z})^{-1/3}}{2^{-1/3}\sqrt{1-z}^z} z^{1/6} \right) \]
\[ = \frac{(1 + \sqrt{1 - z})^{1/3}}{3\pi\sqrt{1-z}} z^{-1/6} + \frac{(1 + \sqrt{1 - z})^{-1/3}}{3\pi\sqrt{1-z}} z^{1/6}. \]

Finally, by (3.14) we have $V_{3/2,1/2}(x) = \sqrt{3} V_{3/2,0}(x)$, which leads to the third formula.

Let us mention that the integer sequence $\left(\frac{3n}{n} - \frac{1}{2}\right)4^n$:

\[ 1, 4, 30, 256, 2310, 21504, 204204, 1966080, 19122246, \ldots \]

appears in OEIS as A091527. It is the moment sequence of the density function
\[ V(x) := V_{3/2,-1/2}(x/4)/4 \]
\[ = \frac{x^{4/3} + 9 \cdot \sqrt[4]{3} (1 + \sqrt{1 - x^2/108})^{1/3}}{2^{8/3} \cdot 3^{3/2} \cdot \pi \cdot x^{4/3} \sqrt{1 - x^2/108}(1 + \sqrt{1 - x^2/108})^{2/3}} \] (5.2)
on $(0, 6\sqrt{3})$ (see Theorem 5.2) and its generating function is $D_{3/2,-1/2}(4z)$ (see Corollary 2.3). The even numbered terms constitute sequence A061162, i.e.

A091527(2n) = A061162(n) = $\left(\frac{3n - 1/2}{2n}\right) 16^n = \frac{(6n)!n!}{(3n)!(2n)!^2}$.

so this is the moment sequence for the density function
\[ \overline{V(x)} = \frac{x^{2/3} + 9 \cdot \sqrt[4]{3} (1 + \sqrt{1 - x/108})^{4/3}}{2^{11/3} \cdot 3^{5/2} \cdot \pi \cdot x^{5/6} \sqrt{1 - x/108}(1 + \sqrt{1 - x/108})^{2/3}} \] (5.3)
on the interval $(0, 108)$.

From (3.13) we can also write the measures $\nu(3, -1)$ and $\nu(3/2, -1)$:
\[ \nu(3, -1) = \frac{1}{3} \delta_0 + \frac{2}{3} V_{3,0}(x)dx, \] (5.4)
\[ \nu(3/2, -1) = \frac{2}{3} \delta_0 + \frac{1}{3} V_{3/2,0}(x)dx. \] (5.5)
6. Some Convolution Relations

In this section we are going to prove a few formulas involving the measures \( \nu(p, r) \), \( \mu(p, r) \) and various types of convolutions. First we observe that the families \( \nu(p, r) \) and \( \mu(p, r) \) are related through the Mellin convolution.

**Proposition 6.1.** For \( c > 0 \) define probability measure \( \eta(c) \) by

\[
\eta(c) := c \cdot x^{c-1}dx, \quad x \in [0, 1].
\]

Then for \( p > 1, 0 < r \leq p \) we have

\[
\nu(p, r - 1) \circ \eta(r / (p - 1)) = \mu(p, r).
\]

**Proof.** Since the moment sequence of \( \eta(c) \) is \( \{np + r - 1\} \), it is sufficient to note that

\[
\frac{np + r - 1}{n} \cdot \frac{r}{n(p - 1) + r} = \frac{np + r}{np + r}.
\]

Note that Theorem 5.1 in Ref. 6 is a consequence of Theorem 3.2 and Proposition 6.1.

For a compactly supported probability measure \( \mu \) on \( \mathbb{R} \) define its moment generating function by

\[
M_{\mu}(z) := \int_{\mathbb{R}} \frac{1}{1 - xz} d\mu(x),
\]

in particular \( M_{\nu(p, r)}(z) = B_p(z)^r \) and \( M_{\nu(p, r)}(z) = D_{p, r}(z) \). For two such measures \( \mu_1, \mu_2 \) we define their monotonic convolution by

\[
M_{\mu_1 \triangleright \mu_2}(z) = M_{\mu_1}(zM_{\mu_2}(z)) \cdot M_{\mu_2}(z).
\]

It is an associative, noncommutative operation on probability measures on \( \mathbb{R} \).

Let \( \mu \) be a probability measure with compact support contained in the positive half-line \( [0, +\infty) \) and \( \mu \neq \delta_0 \). Then the \( S \)-transform, defined by

\[
M_{\mu} \left( \frac{z}{1 + z} S_{\mu}(z) \right) = 1 + z
\]

can be used to describe the dilation \( D_c \mu \), the multiplicative free power \( \mu^\triangleright_p \), the additive free power \( \mu^{\triangledown_t} \) and the Boolean power \( \mu^{\sqcup_u} \) by:

\[
\begin{align*}
S_{D_c \mu}(z) &= \frac{1}{c} S_{\mu}(z), \quad (6.1) \\
S_{\mu^\triangleright_p}(z) &= S_{\mu}(z)^p, \quad (6.2) \\
S_{\mu^{\triangledown_t}}(z) &= \frac{1}{t} S_{\mu} \left( \frac{z}{t} \right), \quad (6.3) \\
S_{\mu^{\sqcup_u}}(z) &= \frac{1}{u} S_{\mu} \left( \frac{z}{u + (u - 1)z} \right). \quad (6.4)
\end{align*}
\]
These measures are well defined\textsuperscript{9,17} (and have compact support contained in the positive half-line) for $c, u > 0$ and at least for $p, t \geq 1$. The Boolean power can also be described through the moment generating function:

$$M_{\mu^{\otimes s}}(z) = \frac{M_{\mu}(z)}{u - (u - 1)M_{\mu}(z)}.$$  

For example, $S_{\mu(p, 1)}(z) = (1 + z)^{1-p}$, which implies that $\mu(p, 1) = \mu(2, 1)^{\otimes p-1}$.

Recall\textsuperscript{9} three formulas, which are consequences of (2.8) and of the identity:

$$\mathcal{B}_{p-r}(z\mathcal{B}_p(z)^r) = \mathcal{B}_p(z).$$

**Proposition 6.2.** For $p \geq 1$, $-1 \leq r \leq p - 1$ and $0 \leq a, b, s \leq p$ we have

$$\nu(p, 0) = \mu(p, 1)^{\otimes p} = (\mu(2, 1)^{\otimes p-1})^{\otimes p},$$  

(6.5)

$$\mu(p, a) \triangleright \mu(p + b, b) = \mu(p + b, a + b),$$  

(6.6)

$$\nu(p, r) \triangleright \nu(p + s, s) = \nu(p + s, r + s).$$  

(6.7)

In particular, if $0 \leq r \leq p - 1$ then

$$\nu(p, r) = \nu(p - r, 0) \triangleright \nu(p, r) = \mu(p - r, 1)^{\otimes p-r} \triangleright \mu(p, r).$$

The formulas (6.6) and (6.7) will be applied in the next section.

Finally we observe that $\nu(p, -1)$ and $\nu(p, 0)$ are free convolution powers of the Bernoulli distribution.

**Proposition 6.3.** For $p > 1$ we have

$$\nu(p, -1) = D_{c(p)} \left( \frac{1}{p} \delta_0 + \frac{p - 1}{p} \delta_1 \right)^{\otimes p},$$

(6.8)

where $c(p) = p^p(p-1)^{1-p}$, and

$$\nu(p, 0) = D_p \left( \frac{1}{p} \delta_0 + \frac{p - 1}{p} \delta_1 \right)^{\otimes p/(p-1)}^{\otimes p-1}.$$  

(6.9)

**Proof.** First we prove that

$$S_{\nu(p, -1)}(z) = \frac{(p - 1)^{p-1}}{p^p} \left( \frac{1 + z}{p - 1 + z} \right)^p,$$  

(6.10)

$$S_{\nu(p, 0)}(z) = \frac{(p - 1)^{p-1}}{p^p} \left( \frac{p + z}{1 + z} \right)^{p-1}.$$  

(6.11)

Indeed, putting $w = \frac{z^p}{(p-1)(1+z)}$ we have $1 + w = \frac{p^p - p - 1}{(p-1)(1+z)}$. Now applying formula $\mathcal{B}_p(w(1 + w)^{-p}) = 1 + w$ (see Proposition 3.3 in Ref. 6), together with (2.8), we get

$$D_{p,-1}(w(1 + w)^{-p}) = \frac{1}{p - (p - 1)(1 + w)} = 1 + z.$$
Similarly, putting \( v = \frac{z}{p-1+pz} \) we get \( 1 + v = \frac{p(1+z)}{p-1+pz} \) and
\[
D_{p,0}(v(1 + v)^{-p}) = \frac{1 + v}{p - (p - 1)(1 + v)} = 1 + z.
\]

Now it remains to note that the \( S \)-transform of \( \alpha \delta_0 + (1 - \alpha) \delta_a \), with \( 0 < \alpha < 1 \), \( a > 0 \), is
\[
\frac{1}{\alpha(1-\alpha+z^2)}.
\]

Let us note two particular cases:
\[
\nu(2,-1) = D_4 \left( \frac{1}{2} \delta_0 + \frac{1}{2} \delta_1 \right)^{\boxplus 2} \quad \text{and} \quad \nu(2,0) = D_2 \left( \frac{1}{2} \delta_0 + \frac{1}{2} \delta_1 \right)^{\boxplus 2}.
\]

7. The Necessary Conditions for Positive Definiteness

This section is fully devoted to the necessary conditions for the positive definiteness of the binomial (1.1) and Raney (1.3) sequences.

For the Raney sequence (1.3) we have
\[
\binom{np+r}{n} \frac{r(-1)^n}{np+r} = \binom{n(p-1)-r}{n} \frac{-r}{n(1-p)-r}
\]
which yields (2.9) and
\[
\mu(1-p,-r) = \mu(p,r).
\]

Therefore, if either \( p \geq 1 \), \( 0 \leq r \leq p \) or \( p \leq 0 \), \( p-1 \leq r \leq 0 \) then the Raney sequence (1.3) is positive definite (apart from the proofs from Refs. 6 and 7, now this is a consequence of Theorem 3.2 and Proposition 6.1). In the latter case the support of \( \mu(p,r) \) is contained in the negative half-line \( (-\infty,0] \). In addition, if \( r = 0 \) then the sequence is just \( (1,0,0,...) \), the moment sequence of \( \delta_0 \).

We are going to prove that these statements fully characterize positive definiteness of these sequences. We will need the following

**Lemma 7.1.** Let \( \{s_n\}_{n=0}^{\infty} \) be a sequence of real numbers and let \( w : (a, b) \to \mathbb{R} \) be a continuous function, such that \( w(x_0) < 0 \) for some \( x_0 \in (a, b) \) and there is \( N \) such that \( s_n = \int_a^b x^n w(x)dx \) for \( n \geq N \). Then \( \{s_n\}_{n=0}^{\infty} \) is not positive definite.

**Proof.** Put \( w_0(x) := w(x)x^{2N} \) and \( a_n := s_{2N+n} \). Then \( a_n := \int_a^b w_0(x)x^n dx \) and in view of the uniqueness part of the Riesz representation theorem for linear functionals on \( C[a,b] \) and of the Weierstrass approximation theorem, the sequence \( \{a_n\}_{n=0}^{\infty} \) is not positive definite. Since
\[
\sum_{i,j} a_{i+j} \alpha_i \alpha_j = \sum_{i,j} s_{(N+i)+(N+j)} \alpha_i \alpha_j,
\]
the sequence \( \{s_n\}_{n=0}^{\infty} \) is not positive definite too. \( \square \)
Now we are ready to prove the main result of this section. Note that formulas (6.6) and (6.7) play key role in the proof.

**Theorem 7.1.** (1) The binomial sequence (1.1) is positive definite if and only if either \( p \geq 1, -1 \leq r \leq p - 1 \) or \( p \leq 0, p - 1 \leq r \leq 0 \).

(2) The Raney sequence (1.3) is positive definite if and only if either \( p \geq 1, 0 \leq r \leq p \) or \( p - 1 \leq r \leq 0 \) or else \( r = 0 \).

**Proof.** We need only to prove that these conditions are necessary.

First we note that the maps \((p, r) \mapsto (1 - p, -1 - r)\) and \((p, r) \mapsto (1 - p, -r)\) are reflections with respect to the points \((1/2, -1/2)\) and \((1/2, 0)\) respectively. Therefore it is sufficient to confine ourselves to \( p \geq 1/2 \). First we will show that if the binomial sequence (1.1) (respectively the Raney sequence 1.3) is positive definite and \( p \geq 1/2 \) then \( p \geq 1 \) (or \( r = 0 \) in the case or Raney sequence).

We will use the fact that if a sequence \( \{s_n\}_{n=0}^{\infty} \) is positive definite then \( s_{2n} \geq 0 \) and \( \text{det}(s_{i+j})_{i,j=0}^{n} \geq 0 \) for all \( n \in \mathbb{N} \). Then the necessary condition \( \text{det}(s_{i+j})_{i,j=0}^{1} \geq 0 \) is equivalent to

\[
2p^2 - 2p - r - r^2 \geq 0, \quad (7.3)
\]

for the binomial sequence (1.1) and

\[
r(2p - r - 1) \geq 0 \quad (7.4)
\]

for the Raney sequence (1.3).

Assume that \( 1/2 \leq p < 1, r \in \mathbb{R} \) and that the binomial sequence (1.1) is positive definite. Then (7.3) implies that \( -1 \leq r \leq 0 \) and \( \frac{1}{2} + \frac{1}{r} \sqrt{1 + r + r^2} \leq p < 1 \), which, in turn, implies \( \frac{1}{2} + \frac{1}{r} \leq p < 1 \). Hence \( 0 < 1 - p < 1/2 \) and there exists \( n_0 \) such that

\[
r + 1 < n_0(1 - p) < (n_0 + 1)(1 - p) < r + 2.
\]

This implies

\[
\left(\begin{array}{c} n_0 p + r \\ n_0 \end{array}\right) = \frac{1}{n_0!} \prod_{i=1}^{n_0} (n_0(p - 1) + r + i) < 0
\]

and

\[
\left(\begin{array}{c} (n_0 + 1)p + r \\ n_0 + 1 \end{array}\right) = \frac{1}{(n_0 + 1)!} \prod_{i=1}^{n_0+1} ((n_0 + 1)(p - 1) + r + i) < 0
\]

(the first factor is negative, all the others are positive), which contradicts positive definiteness of the sequence because one of the numbers \( n_0, n_0 + 1 \) is even.

Similarly, if \( 1/2 \leq p < 1, r \neq 0 \) and the Raney sequence is positive definite then (7.4) implies that \( 1/2 < p < 1 \) and \( 0 < r \leq 2p - 1 \). Hence we can choose \( n_0 \) in the same way as before, so that

\[
\left(\begin{array}{c} n_0 p + r \\ n_0 \end{array}\right) = \frac{r}{n_0!} \prod_{i=1}^{n_0-1} (n_0(p - 1) + r + i) < 0
\]
and
\[
\frac{(n_0 + 1)p + r}{n_0 + 1} \frac{r}{(n_0 + 1)p + r} = \frac{r}{(n_0 + 1)!) \prod_{i=1}^{n_0} ((n_0 + 1)(p - 1) + r + i) < 0,
\]
which contradicts positive definiteness of the Raney sequence (1.3).

So far we have proved that if \( p \geq 1/2 \) and the binomial sequence (1.1) (respectively the Raney sequence (1.3)) is positive definite (and if \( r \neq 0 \) for the case of Raney sequence) then \( p \geq 1 \). For \( p = 1 \) the conditions (7.3) and (7.4) imply that \(-1 \leq r \leq 0 \) and \( 0 \leq r \leq 1 \) respectively. From now on we will assume that \( p > 1 \).

Now we will work with the Raney sequences. Denote by \( \Sigma \) the set of all pairs \((p, r)\) such that \( p \geq 1 \) and (1.3) is positive definite. By (7.4), if \((p, r)\in \Sigma \) then \( r \geq 0 \).

Recall that if \( p=k/l, \ 1 \leq l < k \) and \( r > 0 \) then, in view of Theorem 3.2 in Ref. 7 we have
\[
\binom{np + r}{n} \frac{r}{np + r} = \int_0^{c(p)} x^n \cdot W_{p,r}(x)dx,
\]
for some \( x > 0 \). Indeed we have
\[
\int_0^{c(p)} x^n \cdot W_{p,r}(x)dx = c(k,l) \sum_{h=1}^k \tilde{c}(h,k,l,r) \prod_{\rho=h+1}^k \Gamma\left(\frac{2-h}{l}\right) \prod_{j=1}^h \Gamma\left(\frac{j-l}{k}\right) \frac{\prod_{\rho=h+1}^k \Gamma\left(\frac{2-h}{l}\right)}{\prod_{j=1}^h \Gamma\left(\frac{j-l}{k}\right)}.
\]
Now we are going to prove that if \( p=k/l > 1 \) and \( p < r < 2p \) then \( W_{p,r}(x) < 0 \) for some \( x > 0 \). Indeed we have \(-1 < \frac{1}{k} - \frac{1}{l} < 0 \) if \( j \geq 2 \) and \( \frac{1}{k} - \frac{1}{l} > 0 \) for \( j < l \). Therefore \( c(1,k,l,r) < 0 \) and then we can express \( W_{p,r} \) as
\[
W_{p,r}(x) = x^{r/p-1} \sum_{h=1}^k \phi_h(x)x^{(h-1)/p},
\]
where \( \phi_h(x) \) are continuous functions on \([0, c(p)]\) and \( \phi_1(0) < 0 \). This implies that \( W_{p,r}(x) < 0 \) if \( x > 0 \) is sufficiently small and therefore, by Lemma 7.1, the sequence is not positive definite in this case.

We note in passing that alternatively one could use formula
\[
\tilde{c}(h,k,l,r) = \frac{\prod_{\rho=1}^{h-1} \Gamma\left(\frac{h-1}{l}\right) \prod_{j=h+1}^k \Gamma\left(\frac{h-j}{l}\right)}{\prod_{j=1}^h \Gamma\left(\frac{j-l}{k}\right)} \sin\left(\frac{r+h-1}{p}\right) \frac{\sqrt{\prod_{\rho=1}^{h-1} \Gamma\left(\frac{h-1}{l}\right) \prod_{j=h+1}^k \Gamma\left(\frac{h-j}{l}\right)}}{(-1)^{h-1} \left(\frac{r+h-1}{p} - h + 1\right) \sqrt{\pi}}.
\]
whose proof is analogous to that of Proposition 4.1.

1450014-27
Proof. In view of Theorem 13.16 in Ref. 9, a compactly supported measure \( \mu \) on \( \mathbb{R} \), with free cumulant sequence \( \{r_n\}_{n=1}^\infty \), is \( \mathbb{H} \)-infinitely divisible if and only if the sequence \( \{r_{n+2}\}_{n=0}^\infty \) is positive definite (i.e. is a moment sequence of a positive measure on \( \mathbb{R} \)). Denote \( A_n(p, r) := \langle \frac{(t^{n+r})}{n+r} \rangle_{t>0} \). We know from Proposition 4.2 in Ref. 6 that the free cumulants of \( \mu(p, r) \) are \( A_n(p-r, r) \). Now, the sequence \( \{A_{n+2}(p-r, r)\}_{n=0}^\infty \) is positive definite if and only if the sequence \( \{A_n(p-r, r)\}_{n=0}^\infty \) and the corresponding measure is \( x^2 \cdot \mu(p-r, r)(x)dx \). This leads to the conclusion. \( \square \)
8. Graphical Illustrations of Selected Cases

The formulas (4.9) and (4.13) allow us to study the graphical representation of the function $V_{p,r}(x)$ for given $p = k/l > 1$ and $r \in \mathbb{R}$. Figure 2 shows $V_{p,0}(x)$ for $p = i/2$, $i = 3,4,5,6,7$. Figures 3–5 illustrate $V_{3/2,r}$, $V_{5/3,r}$ and $V_{7/2,r}$ for various $x$.

Fig. 2. Density functions $V_{p,0}(x)$ for some values of $p$.

Fig. 3. Some examples of $V_{p,r}$ for $p = 3/2$. Note that for $r = 3/4$ and 1 the function $V_{3/2,r}(x)$ also has negative values.
choice of $r$, including $r > p - 1$ when $V_{p,r}(x)$ is negative for some $x$. Those $V_{p,r}$'s which have negative parts are plotted with dashed lines. Finally, in Fig. 6, we show graphs of $V_{p,-3/2}(x)$ for some values of $p$. Each of these functions is negative for some values of $x$. 

Fig. 4. Some examples of $V_{p,r}(x)$ for $p = 5/3$. 

Fig. 5. Some examples of $V_{p,r}(x)$ for $p = 7/2$.
