AN INVARIANCE PRINCIPLE FOR WEAKLY DEPENDENT STATIONARY GENERAL MODELS

Paul Doukhan
Olivier Wintenberger

Abstract: The aim of this paper is to refine a weak invariance principle for stationary sequences given by Doukhan and Louhichi [10]. Since our conditions are not causal, our assumptions need to be stronger than the mixing and causal $\theta$-weak dependence assumptions used in Dedecker and Doukhan [5]. Here, if moments of order greater than 2 exist, a weak invariance principle and convergence rates in the CLT are obtained; Doukhan and Louhichi [10] assumed the existence of moments with order greater than 4. Besides the $\eta$- and $\kappa$-weak dependence conditions used previously, we introduce a weaker one, $\lambda$, which fits the Bernoulli shifts with dependent inputs.

2000 AMS Mathematics Subject Classification: Primary: 60F17.

Key words and phrases: Invariance principle, weak dependence, the Bernoulli shifts.
